

Background

Oakwood Environmental Services was established in 2000, to provide focused solutions to a range of Source Emissions, Air Quality and Quality Assurance issues.

We have pioneered the use of technology and it's application to show compliance with environmental legislation.

Dr Roger S Brown MICWM CSci CChem FRSC

Why are we qualified to provide Training? Dr Roger Brown, an ex-chairman of the Source Testing Association has been a Source Emission Testing Specialist for over 20 years. He managed independent monitoring contracts for HMIP and later the Environment Agency and sat on MCerts Committees on behalf of the Source Testing Association during the Introduction of the MCerts Schemes for both Instrumentation and Personnel. Roger has also been trained as a UKAS Technical Assessor.

The Auditing Training Course

The training course is focused to provide tailored instruction in the auditing of outside contractors or in-house teams where they are providing data for legislative compliance. Operators falling under PPC Permitting and the OMA-3 Scheme must carry out periodic auditing of stack-emission monitoring activities.

The course is ideally a 2 day course covering the requirements of the Standard Methods being applied at your site and identifying the key components and activities which require calibration and control. The course will provide sufficient detail to identify where more information is required from contractors and allow auditing of reports and basic calculations to confirm the validity of data obtained on site and the subsequent reporting of that data.

This is very much a practical course it will involve looking at example equipment, reviewing how it works and providing a review of the information required to conduct a test by a contractor. The course will look at the application of the equipment to the actual site. it will provide insight into:

- The Methods
- Standards

En1948 Pt 1 Sampling Train for Dioxin/Furan Measurements

- Site Specific Protocols
- Health & Safety Requirements
- Calibration of Equipment
- Data collection
- Manipulation of that data
- Reporting
- Quality Assurance and Uncertainty Calculations

The course is designed around the specific needs of the client and will

only cover relevant topics. In addition the courses will be provided at

the site and as such, can review particular needs and difficulties of sampling locations. The Course can accommodate up to 10 people and be woven around site work patterns where necessary.

Other Training Courses are available on application.
